## Statistical Appendix for Chapter 2 of World Happiness Report 2020

John F. Helliwell, Haifang Huang, Shun Wang, and Max Norton February 29, 2020

## 1 Data Sources and Variable Definitions

- Happiness score or subjective well-being (variable name ladder): The survey measure of SWB is from the Feb 28, 2020 release of the Gallup World Poll (GWP) covering years from 2005 to 2019. Unless stated otherwise, it is the national average response to the question of life evaluations. The English wording of the question is "Please imagine a ladder, with steps numbered from 0 at the bottom to 10 at the top. The top of the ladder represents the best possible life for you and the bottom of the ladder represents the worst possible life for you. On which step of the ladder would you say you personally feel you stand at this time?" This measure is also referred to as Cantril life ladder, or just life ladder in our analysis.
- The statistics of GDP per capita (variable name gdp) in purchasing power parity (PPP) at constant 2011 international dollar prices are from the November 28, 2019 update of the World Development Indicators (WDI). The GDP figures for Taiwan, Syria, Palestine, Venezuela, and Djibouti, up to 2017, are from the Penn World Table 9.1.
  - GDP per capita in 2019 are not yet available as of December 2019. We extend the GDP-per-capita time series from 2018 to 2019 using country-specific forecasts of real GDP growth in 2019 first from the OECD Economic Outlook No 106 (Edition November 2019) and then, if missing, forecasts from World Bank's Global Economic Prospects (Last Updated: 06/04/2019). The GDP growth forecasts are adjusted for population growth with the subtraction of 2017-18 population growth as the projected 2018-19 growth.
- Healthy Life Expectancy (HLE). Healthy life expectancies at birth are based on the data extracted from the World Health Organization's (WHO) Global Health Observatory data repository. The data at the source are available for the years 2000, 2005, 2010, 2015 and 2016. To match this report's sample period (2005-2019), interpolation and extrapolation are used.

- Social support (or having someone to count on in times of trouble) is the national average of the binary responses (either 0 or 1) to the GWP question "If you were in trouble, do you have relatives or friends you can count on to help you whenever you need them, or not?"
- Freedom to make life choices is the national average of responses to the GWP question "Are you satisfied or dissatisfied with your freedom to choose what you do with your life?"
- Generosity is the residual of regressing national average of response to the GWP question "Have you donated money to a charity in the past month?" on GDP per capita.
- Corruption Perception: The measure is the national average of the survey responses to two questions in the GWP: "Is corruption widespread throughout the government or not" and "Is corruption widespread within businesses or not?" The overall perception is just the average of the two 0-or-1 responses. In case the perception of government corruption is missing, we use the perception of business corruption as the overall perception. The corruption perception at the national level is just the average response of the overall perception at the individual level.
- Positive affect is defined as the average of three positive affect measures in GWP: happiness, laugh and enjoyment in the Gallup World Poll waves 3-7. These measures are the responses to the following three questions, respectively: "Did you experience the following feelings during A LOT OF THE DAY yesterday? How about Happiness?", "Did you smile or laugh a lot yesterday?", and "Did you experience the following feelings during A LOT OF THE DAY yesterday? How about Enjoyment?" Waves 3-7 cover years 2008 to 2012 and a small number of countries in 2013. For waves 1-2 and those from wave 8 on, positive affect is defined as the average of laugh and enjoyment only, due to the limited availability of happiness.
- Negative affect is defined as the average of three negative affect measures in GWP. They are worry, sadness and anger, respectively the responses to "Did you experience the following feelings during A LOT OF THE DAY yesterday? How about Worry?", "Did you experience the following feelings during A LOT OF THE DAY yesterday? How about Sadness?", and "Did you experience the following feelings during A LOT OF THE DAY yesterday? How about Anger?"
- Gini of household income reported in the Gallup World Poll (variable name giniIncGallup). The income variable is described in Gallup's "WORLDWIDE RESEARCH METHODOLOGY AND CODEBOOK" (Updated July 2015) as "Household Income International Dollars [...] To calculate income, respondents are asked to report their household income in local currency. Those respondents who have difficulty answering the question are presented a set of ranges in local

currency and are asked which group they fall into. Income variables are created by converting local currency to International Dollars (ID) using purchasing power parity (PPP) ratios." The gini measure is generated using STATA command  $ineqdec\theta$  by WP5-year with sample weights.

• GINI index from the World Bank (variable name giniIncWB and giniIncW-Bavg) from the World Development Indicators. The variable labeled at the source as "GINI index (World Bank estimate)", series code "SI.POV.GINI". According to the source, the data source is "World Bank, Development Research Group. Data are based on primary household survey data obtained from government statistical agencies and World Bank country departments." The variable giniIncWB is an unbalanced panel of yearly index. The data availability is patchy at the yearly frequency. The variable giniIncWBavg is the average of giniIncWB in the period 2000-2017. The average does not imply that a country has the gini index in all years in that period. In fact, most do not.

## 2 Coverage, Summary Statistics and Regression Tables

WP5 is GWP's coding of countries including some sub-country territories such as Hong Kong. Not all the countries and territories appear in all the years. Our analysis does not cover all of the country/territories that have valid happiness scores. Tables 1-5 show the WP5-year pairs that are covered.

The 2017-2019 ranking of happiness scores includes 153 countries/territories that have the happiness scores in the 2017-2019 period.

To appear in regression analysis that uses data from outside the GWP survey, a WP5-year needs to have the necessary external information (GDP, healthy life expectancy, etc). The regression analysis thus does not necessarily cover all of the countries/territories in the GWP. Nor does it necessarily cover all the countries/territories that are ranked by their happiness scores in this report. The underlying principle is that we always use the largest available sample. For different kind of analysis/ranking, the largest available samples can be different.

Regions: Some of the analysis includes dummy indicator for regions, namely Western Europe, Central and Eastern Europe, Commonwealth of Independent States, Southeast Asia, South Asia, East Asia, Latin America and Caribbean, North America and ANZ, Middle East and North Africa, and Sub-Saharan Africa. A later set of tables list individual countries by their region grouping.

## 3 Imputed Missing Values in Our Exercise of Explaining Ladder Scores with Six Factors

We do not make use of any imputed missing values in any of our headline results including the happiness rankings and all the regression outputs. The only place where we make use of imputation is when we try to decompose a country's average ladder score into components explained by six hypothesized underlying determinants (GDP per person, healthy life expectancy, social support, perceived freedom to make life choice, generosity and perception of corruption). A small number of countries have missing values in one or more of these factors. The most prominent is about the perception of corruption in businesses and governments. In several countries, the relevant questions were not asked in the Gallup World Poll. For these countries we impute the missing values using the "control of corruption" indicator from the Worldwide Governance Indicators (WGI) project. Specifically, the imputed value is calculated as the predicted value using estimates from a model that regresses Gallup World Poll's perception of corruption on WGI's control of corruption. In all, 9 countries, listed in a later table, have the measure of corruption perception imputed in this way.

In a few cases, countries are missing one or more of the happiness factors over the survey period 2017-2019, but the information is available in earlier years; for example they may have GDP statistics in 2015 but not in the period from 2017 to 2019. In this case we use the most recent information as if they are the 2017-2019 information. There is a limit of 3 years for how far back we go in search of those missing values.

A few territories/countries do not have data on healthy life expectancy in the World Health Organization's (WHO) Global Health Observatory data repository. For Hong Kong, we calculate the health life-to-life expectancy ratio using estimates reported in "Healthy life expectancy in Hong Kong Special Administrative Region of China," by C.K. Law, & P.S.F. Yip, published at the Bulletin of the World Health Organization, 2003, 81 (1). The same ratio information for Swaziland in the period 2005-2010 can be found in "Healthy life expectancy for 187 countries, 1990 - 2010: a systematic analysis for the Global Burden Disease Study 2010," by Joshua A Salomon et al, The Lancet, Volume 380, Issue 9859. We then multiply the ratios for Hong Kong and Swaziland, respectively, with their life expectancy time series in the WDI to get the health life expectancy up to 2017. The time series is then extrapolated to 2019. The Lancet article also provides information for Taiwan and the Palestinian Territories. But the WDI does not provide life expectancy data for these two regions. For these two, we use their 2010 healthy life expectancy data as if they are the 2017-2019 value. For Kosovo, we adjust its time series of life expectancy (available in the World Development Indicators) to a time series of health life expectancy by assuming that its health life-to-life expectancy ratio equals to the world average.

Northern Cyprus is missing GDP per capita, Healthy, life expectancy, as well as the measure of Generosity; we use the statistics of Cyprus instead.

Notes: 1) Column 1 reports estimates from a pooled OLS regression based on data used in the WHR 2019 (sample period 2005-2018). Column 2 replicates the regression with updated data. Note that WHR 2019 regression includes Kosovo that uses imputed healthy life expectancy. WHR 2020 no longer includes Kosovo in the regression analysis. Whether Kosovo is included in the regression or not has virtually no impacts on the reported estimates. 2). Standard errors in parentheses. \*, \*\*, and \*\*\* indicate statistical significance at 10 percent, 5 percent and 1 percent levels. All standard errors are cluster-adjusted at the country level. The row "e(N-clust)" indicates the number of

Notes: 1). Standard errors in parentheses. \*, \*\*, and \*\*\* indicate statistical significance at 10 percent, 5 percent and 1 percent levels. 2). All standard errors are cluster-adjusted at the country level. The row "e(N-clust)" shows the number of countries (also clusters) in the sample.

Table 18: Countries/territories that are not covered in the decomposition exerise due to missing factors; an empty table means all countries are covered

| Country name | Country | Missing factors |
|--------------|---------|-----------------|
|              |         |                 |

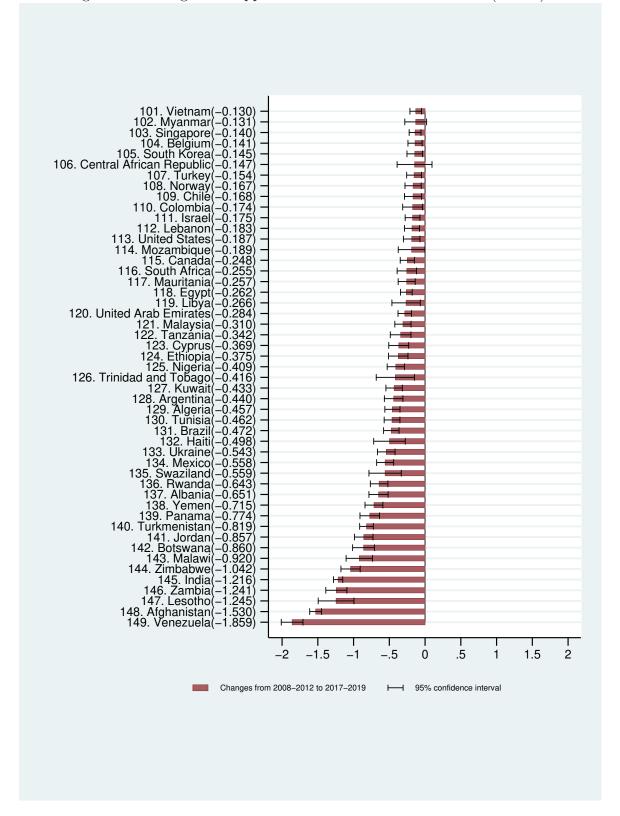

Note: Any countries/territories that are missing per-capita GDP automatically miss Generosity, because we adjust the latter to filter out the influence of per-capita GDP. In addition, any countries/territories that are missing the variable of corruption perception are indeed missing the perception on both business and government.

## Ranking of the Six Factors Used to Explain Happiness Scores

The next set of figures are rankings of countries by the six underlying factors used to explain international differences in happiness scores, namely GDP per person, healthy life expectancy, social support, perceived freedom to make life choice, generosity and perception of corruption. The rankings are based on national averages over the period from 2017 to 2019. The ranking figures do not show imputed data. As we explain when describing our imputation algorithm, we do not use the imputed values in any of our headline results including the happiness rankings. The only place where we use them is when we try to decompose a country's average happiness score into components explained by the six factors. The imputation involves only a small number of countries. Here, we avoid relying on the imputation to generate the rankings. If a country is missing the information about corruption perceptions, for example, they won't show up in the corruption ranking, thus the ranking for corruption will cover a smaller number of countries than the ranking of overall happiness.

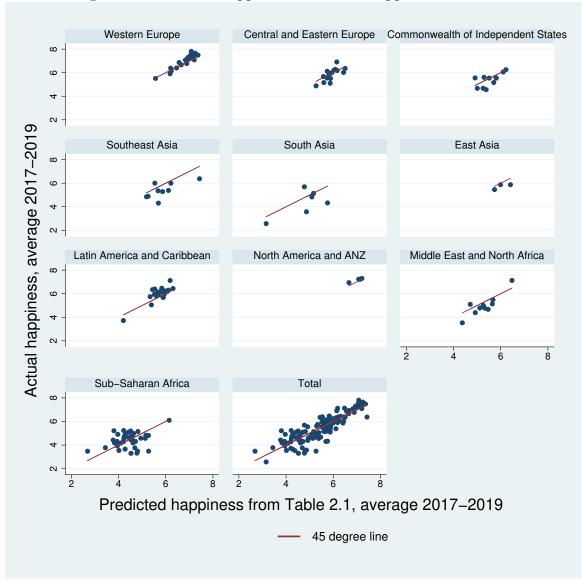

Figure 43: Predicted happiness and actual happiness in 2017-19

Note: These average actual (predicted) happiness scores by country/territory for the 2017-2019 period are weighted averages of the yearly averages by county/territory used in (predicted by) column (1)'s regression in Table 12. The yearly weights are the sums of Gallup-assigned individual weights by country/territory in that year.

Table 20: Decomposing the happiness difference between a hypothetical average country and Dystopia

| Total difference in happiness           |        |              | 4.16                                    |                                      |

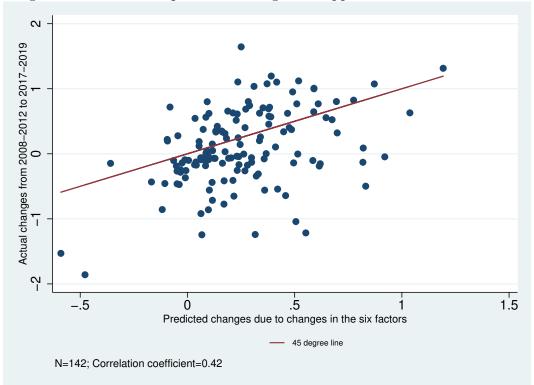

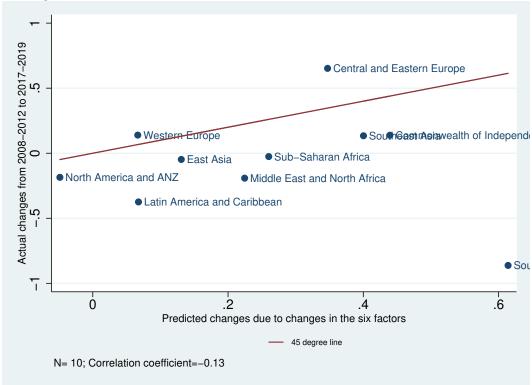

Figure 44: Actual and predicted changes in happiness from 2008-2012 to 2017-19

Note: Defining predicted changes in happiness due to changes in the six factors: Step 1. Take periodical averages (2008-2012 and 2017-19, respectively) of the six factors in the survey data. Step 2. Take difference between the two periods for each of the factors. Step 3. Multiply the differences with corresponding coefficients on the factors in Table 2.1. Step 4. Take the summation of the products from the previous step. The resulted sum is predicted change in ladder due to changes in the six factors.

Figure 45: Actual and predicted changes in happiness from 2008-2012 to 2017-19 at the regional level

Note: This plot at the regional level shows weighted averages of the actual and predicted changes shown in figure 44. The weights for deriving the regional averages are average population from 2005 to 2018.
